Joint exposure patterns and model sensitivity

Whiskers: 95% CI. Primary/IPW: robust variance; 5,914 observations from 3,154 participants.

MI: 20 imputations, model-based variance with Rubin pooling; MI sample counts are unspecified.

DiD P = 0.605 / 0.779 (1 km / 500 m); interaction and precision results are shown in Fig. S9.

Panels use different estimands and sample frames; these associations do not establish effect modification.
